Secondary Cancers and Cardiovascular Disease among Survivors of Childhood, Adolescent, and Young Adult Leukemia and Lymphoma

David Noyd¹, Erin Sullivan

¹Seattle Children's Hospital, Seattle, USA

Background/Purpose

There is a critical need to quantify the burden and engage childhood and young adult cancer survivors at risk for late cardiovascular disease (CVD) to promote health equity. Subsequent malignant neoplasms and CVD represent the leading causes of late morbidity and mortality among childhood, adolescent, and young adult cancer survivors. Previous analyses from the Childhood Cancer Survivor Study (CCSS), and other large, longitudinal cohort studies, clearly document the significant impact of cancer treatment on heart health in adulthood. While many single-institution studies are limited in power to detect rare events and longitudinal follow-up, the National Childhood Cancer Registry offers an opportunity to explore the burden and potential health inequity for SMNs and CVD with a focus on leukemia and lymphoma.

Methods

This study aimed to utilize National Childhood Cancer Registry (NCCR) Data Platform for data analysis of Secondary Cancers and Cardiovascular Disease among Survivors of Childhood, Adolescent, and Young Adult Leukemia and Lymphoma to 1) Quantify the burden of SMNs and identify potential inequities among childhood, adolescent, and young adult leukemia/lymphoma survivors captured by NCCR with linkage to medical claims, quantify the burden of CVD (cardiomyopathy, arrhythmias, and valvular disease) and identify potential inequities, and compare temporal trends in treatment survival and incidence of CVD and SMNs by decade.

Results

Analysis is pending.

Conclusion

The quantification of SMNs, CVD, and temporal trends will guide public health efforts to re-engage survivors at risk for late effects in care at critical time points in their survivorship journey. Moreover, NCCR is a feasible approach to conduct these analyses through linkages with SEER and other data sources.
